

The Inclined Plane

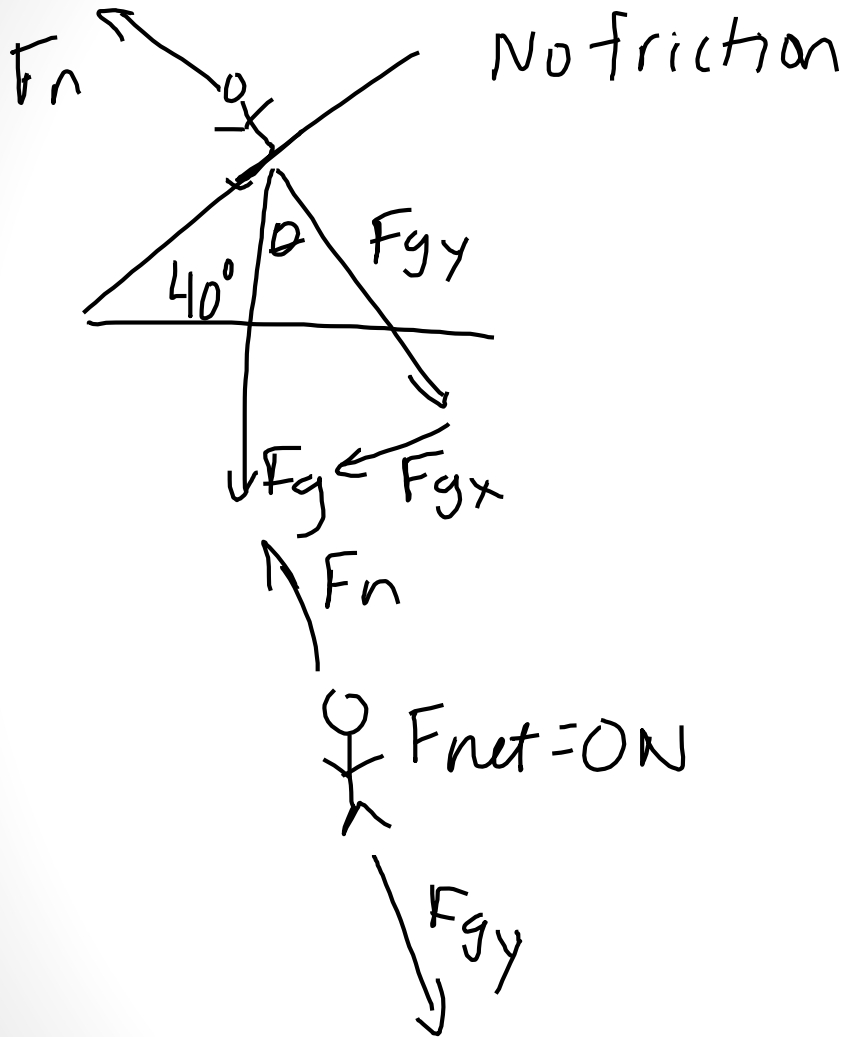

Motion on a ramp inclined at an angle can be analyzed using vectors.

Drawing a free body diagram is essential.

Ex. What is the acceleration of a skier down a 40° hill?

$$\theta = 40^\circ$$

$$F_{\text{net}} = F_{gx}$$

$$\cancel{m}a = \cancel{m}g \sin \theta$$

$$a = g \sin \theta$$

$$a = (9.8) \sin 40^\circ$$

$$a = 6.3 \text{ m/s}^2$$

Ex. A 50 kg person slides down a slide at an angle of 50° to the horizontal. If the coefficient of friction is 0.3 between the child and the slide, what is her acceleration?

What Now

You will use a car on a ramp to determine the value of the coefficient of kinetic friction, μ_k . Don't forget the \pm for the accepted value.

You may have: Ramp, Rulers, Stopwatch, Car, Electronic Balance

What Now?

- How could you find the coefficient of static friction?
- Hmwk: p. 82 # 2, 3; p. 83 # 4, 6
